

**To wipe out
termite colonies
hook, line & sinker,
you need the right bait.**

**Excel**

**The total termite colony
elimination system**

Hello Excel. Goodbye termites. Every last one of them.

An Excel Termite Bait is a termite's worst nightmare.

Termites find Excel Baits irresistible, when in reality what they have found is a sure and certain death for their entire colony.

Once they have fed on an Excel Bait which contains Insect Growth Regulator (IGR), it's the beginning of the end for this insidious pests. IGR impedes the reforming of the termites' exoskeleton so they can't moult, and if termites don't moult they die. Not only that, but healthy termites also feed on the dead termites spreading the bait's effect further throughout the entire colony. The bottom line... within a few months there'll be between 500,000 and 2 million less termites to worry about.

The total termite colony elimination system

Excel finds termites, no matter where they might be.

With Excel, you don't need to locate the colony as the termites will feed on the bait and transfer it back to the nest. All your licensed pest manager needs to do is locate evidence of recent termite activity then set an Excel Bait station. The cellulose content of the bait entices the termite to feed aggressively, ingesting the bait which they invariably transfer back to the nest. Your licensed pest manager will check the baits every two to four weeks and top them up if necessary. How long does it take? That all depends on a number of factors such as; the time of year, weather, geography, termite species and size of the colony. However, total termite colony elimination is usually achieved and confirmed within two to six months.

How your pest controller can be dead sure the colony is eliminated.

Using a scientifically proven method your pest controller will be able to determine when the termite colony has been eliminated. Here's how.

- A visible cream colour change appears, in particular to worker caste termites; this signifies a high uric acid content in the gut.
- A higher ratio of soldier caste termites is evident as the colony moves toward its inevitable elimination.
- A baited station has had active feeding for at least two consecutive months and then had two consecutive monitoring periods with no signs of worker termites feeding on the bait. No termites?

Excel Termite Bait has been tested and proven.

Excel Bait is a scientifically proven, commercially tried and tested product that can and will eliminate an entire termite colony. This treatment is non-invasive and environmentally responsible, posing no threat whatsoever to you, your family, employees or pets.

The active ingredient; hexaflumuron in Excel is a insect growth regulator (IGR). It is registered for termite colony elimination with the Australian Pesticide and Veterinary Medicines Authority (APVMA), the government body that approves products for market registration.

EXCEL is a non-scheduled poison and is non-hazardous to mammals or the environment.

Keeping on top of termites.

So, the termite colony threatening your home or business has been eliminated. That's great, but you must be ever vigilant. To achieve this you may consider installing a chemically treated zone around your home for long term termite protection. Colonies can exist for years before being detected and all premises are at risk no matter how they've been constructed. Termites will enter any building to forage for moisture, cellulose from timber, or timber by-products and in that process even eat electrical cable casing.

For a total peace of mind.

FMC has a full range of proven termite management solutions to protect your property. Please discuss your options with your licensed pest manager.

Say goodbye to termites!
